

Solution Architecture

Date	11 July 2026
Team ID	-
Project Name	Networking Assistant – AI Powered Professional Networking Companion
Maximum Marks	5 Marks

Solution Architecture Diagram

Component Description Table

Component Name	Description / Role in Architecture	Technologies Used
Presentation Layer	Provides an interactive interface where users can analyze events, generate conversation starters, manage contacts, and view networking history.	Streamlit, HTML, CSS
API Gateway / Application Server	Receives client requests, validates input, and routes requests to the appropriate backend services.	FastAPI, Python
Authentication Service	Handles user registration, login, session management, and access control to ensure secure usage.	FastAPI, Python, JWT
Event Analysis Service	Analyzes networking event details to extract key topics, attendees, industry insights, and opportunities.	Google Gemini API, Prompt Engineering
Conversation Engine	Generates personalized conversation starters, icebreakers, and networking suggestions based on user profile and event context.	Google Gemini API, Python
Fact Verification Service	Verifies professional information, company details, and industry facts using AI before presenting to users.	Google Gemini API
Contact Management Service	Stores and manages contacts, interaction history, meeting notes, tags, and user-specific observations.	Python, SQLite / JSON
Follow-up Recommendation Service	Suggests tailored follow-up messages, reminders, and best actions to strengthen professional relationships.	Google Gemini API, Python
External AI Integration	Connects the application with Google Gemini AI for natural language understanding, content generation, and intelligent recommendations.	Google Gemini API,
Data / Storage Layer	Stores user data, contacts, networking history, logs, and application settings securely.	SQLite / JSON Database
